

# Prioritize Safety, Durability and Flexibility for Landscape, Pool and Spa Lighting

CHOOSE NEW *FLEX GOLD™* LED TRANSFORMERS FOR CONSISTENT, SAFER POWER DELIVERY FOR A VARIETY OF LIGHTING APPLICATIONS

UNIQUE  
LIGHTING SYSTEMS®

Design and lifestyle choices have recently led to an increase in water-related landscape features, including swimming pools, cold plunges, fountains and more. This demand is expected to continue growing, and with many safety considerations when electricity is needed near water, contractors need products they can trust to prioritize safety and do the job at hand.

Unique Lighting Systems has developed a solution to ensure safety where water is involved. The new *Flex Gold™* LED Transformers meet both UL-379 (pool & spa) and UL-1838 (landscape lighting) safety standards. Available in three models – 150W, 300W and 600W – these products provide the answer outdoor lighting pros are looking for.

“This is the same reliable product you know, and now, with the added pool & spa safety rating, you can install it in more settings,” said John Davis, product manager at Unique Lighting Systems. “This new series provides flexibility for contractors and homeowners alike.”

Here are five reasons why the new *Flex Gold* LED Transformers should be contractors’ go-to choice:

## SAFETY

Safety is the Number 1 priority when it comes to electricity around water. By having the UL-379 (pool & spa) and UL-1838 (landscape lighting) ratings, these products have third-party validation that they are the right fit for outdoor jobs.

These transformers also have been designed to run cooler, so they are not so hot to the touch. While running hotter typically isn’t a true safety concern for pros, for homeowners, it can be a big deal. Because these transformers do not get hot, they provide peace of mind to customers.

## QUALITY

*Flex Gold* LED Transformers are made with top-quality materials, including stainless steel. Having the box around the transformers made of stainless steel protects the equipment from weather and the chlorine environment it may be installed in. Other models on the market often use plastic or steel covers that are more prone to deterioration in these elements. The efficiency of these transformers is also high quality. With a very low loss of power, this system won’t burn out because of heat and other factors, helping contractors avoid callbacks.

“There are transformers that cost less, and they likely will not last nearly as long,” Davis said. “Customers will more than recoup the difference over the lifespan of the product. Plus, contractors will save time on callbacks, with much happier customers in the long run.”

## RELIABILITY

*Flex Gold* LED Transformers are reliable. Contractors who choose these products don’t have to go through the hassle of replacing transformers and reworking systems. They truly can install it and know the system will perform for years to come.

“The power supply is essential to the system. Without it nothing works. Our power supplies are well-known for being reliable over a long period of time.

Having it work consistently is something we're proud of," Davis said.

## FLEXIBILITY

Choosing *Flex Gold* LED Transformers is choosing flexibility. For contractors, the three available models offer options that meet current needs while allowing room to grow—making it easier to plan for the future without compromise. The multi-tap supports system expansion and changes, taking away the hassle of adding cables to existing points and instead providing additional points to use for added components. Customers will also appreciate having all their lighting connected to the same transformer, so they can just turn on one system instead of multiple systems.

## EASE OF INSTALLATION

A true differentiator of *Flex Gold* LED Transformers is the professional details that are provided to contractors. Unique Lighting Systems offers detailed information so contractors have everything they need to efficiently and effectively collaborate with electricians, engineers and other pros who are part of the project. There's no guessing about what size breaker is needed, volt amp output and more, setting everyone up for success and ensuring it's all done right the first time. This reduces callbacks and improves customer satisfaction – a win-win for contractors.

Choosing the *Flex Gold* LED Transformers is an investment that will pay off for years to come. To learn more about *Flex Gold* LED Transformers, visit [UniqueLighting.com](http://UniqueLighting.com) or your local Unique Lighting Systems distributor.
